Indonesia's Ujung Kulon National Park: A remote site in Java prepared for tourists, but the threat was within

Exploring Ujung Kulon National Park

Ujung Kulon National Park: A remote site in Java prepared for tourists, but the threat was within.

A major exploration of Ujung Kulon National Park, which focuses on the threats it faces, is being conducted in the Pacific, according to an interview with a World Heritage site's representative. The site is one of the most threatened world heritage sites in the world, according to Unesco's World Heritage Centre.

The site is located in the north of Java, Indonesia, and is known for its diverse marine life, including whales and dolphins. The park is considered an important site for marine conservation, with a number of species that are unique to the region.

However, the park faces a number of threats, including overfishing and pollution. In addition, the park is at risk from rising sea levels and climate change. Despite these challenges, the park has made progress in recent years in protecting its marine life.
