WORLD HERITAGE NOMINATION

IUCN TECHNICAL REVIEW

1. IDENTIFICATION NUMBER AND NAME  150  Mammoth Cave National Park

2. LOCATION:  Barren, Edmonson, and Hart Counties, State of Kentucky, United States of America; 86°10'W, 37°10'N.

3. NOMINATED BY:  National Park Service, Department of the Interior, Government of the United States of America

4. DOCUMENTATION:

   (i) Nomination (with maps and photos)
   (ii) Supplementary documentation (IUCN)

      a) Consultation, Dr. M.E. Tuttle, Smithsonian Tropical Research Institute (chiropteran specialist)

      b) Consultation, Dr. Arrigo A. Cigna, President, Union Internationale de Spéléologie

5. BACKGROUND AND SUMMARY

Mammoth Cave National Park includes by far the longest cave system in the world, with known passages extending some 306 kilometres and perhaps an equal length of as yet undiscovered passages. It is of geological importance due to the 100 million years of cave-forming action by the Green River and its tributaries; nearly every type of cave formation is known within the site, and the geological processes involved in cave formation are continuing. The long passages with huge chambers, vertical shafts, stalagmites and stalactites, typsum "flowers" and "needles", and other natural features of the cave system are all superlative examples of their types. The flora and fauna of the cave is the richest caverniculous wildlife known, numbering some 300 species, of which 12 species are rare and endemic to the cave system. Outside the cave, the karst topography is superb, with fascinating landscapes, luxurient vegetation, and abundant wildlife; all of the features of a karst drainage system -- vast recharge area, complex network of underground conduits, sink holes, cracks, fissures, and surface and underground springs -- are found within the site. Mammoth Cave has been important in the development of human culture, with four distinct cultural periods described: Paleo-Indian, Archaic, Woodland, Mississippian. The early Woodland period is particularly important because it marked the independent development of horticulture in the Western Hemisphere.

6. INTEGRITY

The site includes the entire cave system, thus meeting criteria 21 (ii) and (iii). However, the site does not include the entire river catchment of waters flowing through the site, so future disturbance beyond the control of the Responsible Authority is possible, particularly to the south and east of the Park where light industry is replacing agriculture. The Environmental Protection Agency is preparing a study on proposed wastewater facilities for the site and surrounding local communities and small sewage treatment plants for surrounding communities have been funded in part by the National Park Service. Tourism also threatens the site, and some bat colonies have already been disturbed. The Master Plan for the National Park recognizes this danger
and has recommended steps to remove tourist facilities from fragile areas. Much of the cave system is not accessible to the public, and 1980 tourism was 25% less than in 1973; a tourism development plan provides for staging areas outside the cave drainage.

7. COMPARISON WITH OTHER AREAS

Mammoth Cave system is well over twice as long as the next-largest cave system (Höllöch in Switzerland, 135 km). According to Dr. Arrigo A. Cigna, President of the Union Internationale de Spéléologie, "No other cave system in the world can be compared with it".

8. EVALUATION

The limestone caverns of Mammoth Cave contain a natural spectacle of world interest. The site illustrates a number of stages of the Earth's evolutionary history, contains ongoing geological processes, has superlative examples of natural features, and contains unique wildlife. It is protected by the US National Park Service, which has been charged by Congress to manage, develop, interpret and preserve the site. The possible dangers to the integrity of the site have been considered and steps are being taken to limit their influence.

9. RECOMMENDATION

The Mammoth Cave National Park meets the criteria of the Convention and should be placed on the World Heritage List.

International Union for Conservation of Nature and Natural Resources

July 1981 (rev)
UNITED STATES OF AMERICA

NAME Mammoth Cave National Park

MANAGEMENT CATEGORY II (National Park)

World Heritage Site (Criteria: i, ii, iii, iv)

BIOGEOGRAPHICAL PROVINCE 1.9.7 (Chihuahuan)

LEGAL PROTECTION No information

DATE ESTABLISHED 1 July 1941. Accepted as a World Heritage Site in 1981.

GEOGRAPHICAL LOCATION Situated in Barren, Edmonson and Hart Counties, Kentucky. 37°07'30"N-17°30"N, 86°00'00"-17°30"W.

ALTITUDE No information

AREA 21,191ha

LAND TENURE Public ownership except 6 parcels of private land totalling 3.7ha.

PHYSICAL FEATURES The Park contains the longest cave system in the world, with known passages extending some 306km and perhaps an equal length of undiscovered passages. It was formed over 100 million years ago by the Green River and its tributaries and the geological process is continuing. Most types of cave formation are found here and features include the long passages with huge chambers, vertical shafts, stalagmites and stalactites and gypsum "flowers" and "needles". Outside the cave there is superb karst topography with all the features of a karst drainage system - a vast recharge area, complex network of underground conduits, sinkholes, cracks, fissures, and surface and underground springs. Fossils are distributed throughout the rocks of the Mississippian age and include brachiopods, crinoids and corals. Mean annual precipitation is 1,270mm.

VEGETATION Luxuriant vegetation outside the cave system and a rich cave flora. Communities on the surface of the plateau include 84 tree varieties, 28 varieties of shrubs and vines, 29 types of ferns, 209 wildflowers, 67 species of algae, 27 species of fungi and 7 species of bryophytes. The Big Woods basin ecosystem (120ha) is reputed to be one of the best remaining examples of a virgin white oak/black oak Quercus velutina/tulip tree Liriodendron tulipifera forest in eastern North America and the cedar Cedrus sp. karren and savannas of the solution valleys are also of scientific interest.

NOTEWORTHY FAUNA The richest cavernicolous wildlife known, including species endemic to the cave system occur in the Park. There are 41 species of mammals, 203 species of birds, 18 varieties of reptiles, 15 species of amphibians and numerous invertebrates. Bat colonies include the Indiana bat Myotis sodalis (V). Of special concern is the Kentucky cave shrimp Palaemonias ganteri, a freshwater species of uncertain status. The geological setting has contributed to the species richness of the area with the cave system being old enough to have stable communities of fauna from three karst regions within an area large enough for speciation to have occurred. Nowhere else do the blind fish Amblyopsis spelaea and Typhlichthys subterraneus and their spring-cave dwelling relative Chologaster agassizi co-exist. Animal
species considered threatened and found only in the Mammoth Cave area include
Kleptochthonius hageni, K. cerberus, Anthrobia monmouthia, Antriadesmus fragilis, Pseudoanophthalmus audax, P. inexpecatus, Vatrisoides henroti,
Dorypteryx hageni, Arrhopalithes altus, Helicodiscus punctatellus,
Sagittyctythere stygia and Paleomonias ganteri.

CULTURAL HERITAGE  The Park contains evidence of 4 pre-Columbian
Indian cultures: Mississippian, Woodland, Archaic and Paleo-Indian. The early
Woodland culture period is of special archaeological importance because it
shows the first evidence of organized horticulture in North America with
primitive agriculture on river floodplains and was the period of the first
exploration and mining in Mammoth Cave. Several mummies, sandals, campfire
sites, bare foot prints have been found preserved in the stabilizing cave
atmosphere.

ZONING  No information

CONSERVATION MANAGEMENT  The Master Plan for the National Park (1977) has
recommended steps to remove tourist facilities from fragile areas.

DISTURBANCES OR DEFICIENCIES  Damage to some irreplaceable cave
resources occurred during the early periods of cave use, and it is proposed
that further damage be avoided by the relocation of essential visitor services
from the Historic entrance to a peripheral area. The area adjacent to the
Park is now turning from agriculture to light industry. Of major
environmental concern is the Sinkhole Plain to the south and east of the
Park. Precipitation falling on this extensive area collects in underground
streams and is finally discharged into the Green River. Any changes in
quality or quantity of water would adversely affect the unique aquatic life of
the underground streams and alter natural cave development. Tourism is
disturbing the cave system and particularly the bats, however, only limited
access to the cave system is available to the public on organised cave tours.
Tourism was 25% less in 1980 than in 1973 (1.9 million). The scattered
distribution of the few small private tracts makes development in the Park
unlikely.

SCIENTIFIC RESEARCH  A professional geologist is studying the
hydrogeological and environmental relationships at Mammoth Cave. In 1981 the
Environmental Agency was studying the environmental impact of the proposed
wastewater system.

SPECIAL SCIENTIFIC FACILITIES  No information

PRINCIPAL REFERENCE MATERIAL  No information

STAFF  Superintendent for on-site administration assisted by managers
and specialists skilled in administration, resource management, maintenance
and visitor protection.

BUDGET  No information
